**& TABLES OF MEASUREMENTS**

**SUMMARY**

Based upon the original publications from the Great Britain Philatelic Society, this is an updated presentation of the data compiled by Roland Brown and Harold Fisher, to assist plate identification of Great Britain line-engraved, die 1, one penny stamps, the 1d black and the imperforate and perforate 1d red stars.

**BACKGROUND**

Roland Brown devised a system to assist plate identification of Great Britain line-engraved, die 1, one penny stamps, which led to the publication of *The Plating of The Penny* in five volumes. Volumes 1 and 2 were compiled by Roland Brown and edited by Harold Fisher. Volumes 1 [Revised], 3, 4 and 5 were compiled and edited by Harold Fisher. A numerical rearrangement of Volumes 1 to 4, (imperforate die 1 plates 1 to 175), was first compiled and edited by Kurt Otte. A numerical rearrangement of the officially perforated die 1 stamps of Volumes 4 and 5 was compiled and published by this Editor, later followed by a second edition in 2015, updated and expanded to include all issued die 1 plates, 1 to 204 and R,1 to R,6, and a third edition in 2020.

**ACKNOWLEDGEMENTS**

Thanks are due to the Great Britain Philatelic Society and GB Philatelic Publications Ltd for their permission to use the contents of *The Plating of the Penny* for the preparation of the volumes of rearranged Fisher-Brown data and to the on-line Mulready Group for their continuing efforts to locate and provide missing information.

Historically, the original work of Roland Brown and Harold Fisher in the 1970s and 1980s was a remarkable achievement. Although the method and early work was Roland Brown's, with editing by Harold Fisher, the project was ultimately taken over and continued by Fisher alone. This is recognised by the change from Brown-Fisher to Fisher-Brown when referring to the methods or measurements. The idea of producing my original work on the perforated plates stemmed from a gift from Geoffrey Chappell to me of Kurt Otte's personal copy of his book, which had been passed to him by Kurt's widow. The third edition would not have been possible without the work of the Mulready Group, with particular thanks to Brian Perrett. Maurice Buxton has performed miracles in establishing the website of the Great Britain Philatelic Society as an outstanding area of reference for all collectors. With exhaustive cross-referencing and comparison with the original texts and later data, this fourth edition corrects many previous editorial errors and includes all revisions up to February 2021.

Following publication in December 2020 of the first edition of Stanley Gibbons *Queen Victoria Volume 1 Part 1 Great Britain Specialised Stamp Catalogue*, further details and revisions have been incorporated into the plate characteristics section.

Two members of the Great Britain Philatelic Society, Roland Brown and Harold W Fisher, developed a measuring device with which one may read with great accuracy two measurements for each check letter in respect of their spacing from the corner frame lines. Their measurements and notes regarding other identifiable features were first published as *The Plating of The Penny*, by the Great Britain Philatelic Society and GB Philatelic Publications Ltd between 1972 and 1984. The five volumes covered Die 1 plates 1 to 204, and R,1 to R,6. The individual measurements for each pair of check-letters were therein listed by order of plate number.

In 1984 Kurt W Otte published a single volume: *A Rearrangement in Numerical Order of the Brown-Fisher Coordinates of The Plating of The Penny, Volumes 1 to 4, Plates 1-175*, covering the imperforate 1d stamps but omitting plates 176 and 177. His aim was to make the search for the correct plate number a more rational task. He advised that his tables should be regarded as a supplement to *The Plating of the Penny* and users should never forget that the special features and varieties noted must be confirmed on the stamp being studied before the plate number can be firmly established. Official perforation of the British line-engraved 1d stamps commenced in 1854, and sheets of stamps from plates 155, 157, 162 to 204 and R,1 to R,6 were comb-perforated using 16-gauge perforating combs, 'perf 16', listed as SG Spec. C1 or SG 17-18. During 1855 this was gradually superseded by 'perf 14' on sheets of stamps from plates 194 to 198, 200 to 204, and R,1 to R,6 which are listed as SG Spec. C2 or SG 22.

A Rearrangement in Numerical Order of the Brown-Fisher Coordinates of the Perforated Stamps of Volumes 4 & 5 of The Plating of the Penny was compiled and published by this Editor in 2007, and reprinted with some minor revisions in 2010. To mark the Diamond Jubilee of the Great Britain Philatelic Society, a second edition was published in January 2015, with a revised second edition in June 2015. The tables were expanded to include the full range of Die 1 printing plates at press between 1840 and 1855. Plating details for each unit were included, and the tables incorporated the latest findings by members of the GBPS and the Mulready Group. To facilitate easier handling and use of the second edition, the book was split into four parts, and included an enlarged measuring device for overlaying scanned images on a computer screen.

By Volumes 4 and 5 Harold Fisher had stopped using the plating coordinates 'a','b','c' and 'd' to denote the WSW, SSW, SSE, and ESE framelines. The Editor has amended not only the lower but also the upper corner descriptions throughout the text. Additionally, by reference to the imprimatur photographs, direction of skewing of corner frames is recorded. Currently 20 stamps remain to be identified, measured and confirmed.

This new edition is online-only but may be freely downloaded. It provides an up to date record of the Fisher-Brown data, with the rearranged data now displayed alongside the plate order tables. Please note the Editor's decision to include stamp data which are currently provisional and unconfirmed at the date of publication; such information, printed in red, should be treated with some caution. Any errors and/or omissions are entirely the responsibility of the Editor, for which he apologises. Comments, corrections and updates are always welcomed and may be emailed to him at: <mikebatty1947@yahoo.co.uk>

THE PLATING METHOD

In the earlier volumes of *The Plating of the Penny* the method of plating was described exactly and in detail. The following notes give a short and general outline of the measuring procedure, which may be used to identify various one penny stamps with die 1 head and small crown watermark.

SG Spec No	SG No	Shade	Al ph a bet	Separation	
A1	1-3	black	1	imperforate	1–11
A2	7	red-brown	1	imperforate	'black plates' 1, 2, 5 and 8–11
B1	8-12	red-brown	1	imperforate	12–131
CE1	16a	red-brown	1	Archer roulette	70–71
CE2	16b	red-brown	1	Archer perf-16	90–94, *, 96-101, 105, 107, 108, 111, 116
B2	8-12	red-brown	2	imperforate	132–177
C1	17-18	red-brown	2	perf-16	155, 157, 162–204 and R,1–R,6
C2	22	red-brown	2	perf-14	194–198, 200–204 and R,1–R,6

\* During 2019 concerns were expressed regarding the existence of examples of Plate 95 with genuine Archer perforations and this was subsequently removed from the list in 2020.

The particular alphabet of the corner check-letters may be identified with the help of the double-sided, *Fisher Alphabet Comparator*, [Fig. 1]. The *GBPS Line-Engraved Plating Gauge* is a 76mm x 61mm transparent measuring device, [Fig. 2], used as an overlay on the stamp, in combination with a x10 magnifying glass.

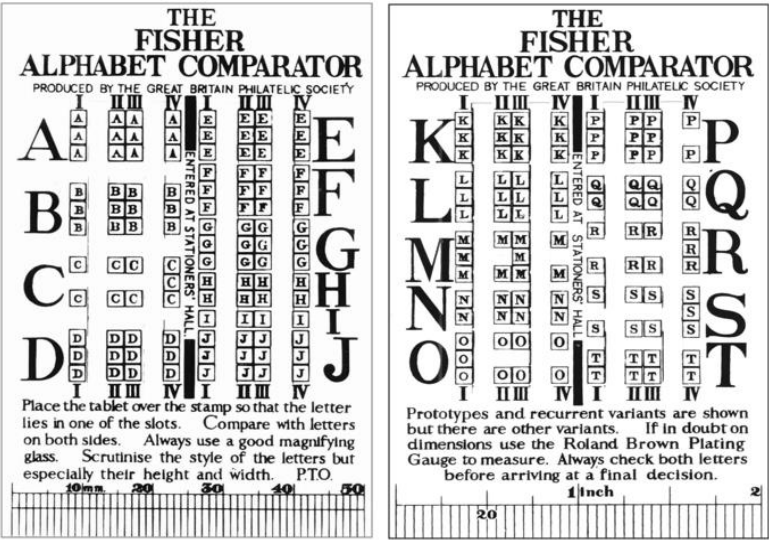

Fig. 1 Alphabet Comparator

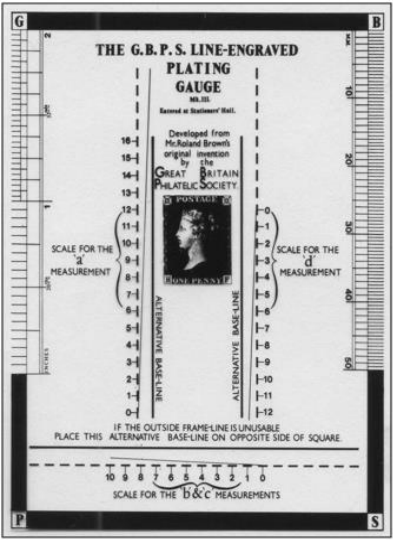

Fig. 2 Plating Gauge

The check-letter positions, which are primarily the basis for plating these stamps, are defined by four measurements, two for each check-letter, as shown below [Fig. 3]: 'a' is the distance from WSW, the outer or west frame of the SW square, to the left check-letter; 'b' is the distance from SSW, the lower or south frame of the SW square, to the left check-letter; 'c' is the distance from SSE, the lower or south frame of the SE square, to the right check-letter; 'd' is the distance from ESE, the outer or east frame of the SE square, to the right check-letter.

Fig. 3 Measurements 'a', 'b', 'c' and 'd'

To determine measurement 'a', the left vertical scale is positioned over the left check-letter of the stamp. Then the dotted base-line line of the scale is aligned so that its right-hand edge coincides with the inside of WSW, the left frame of the SW square. The next step is to slide the scale accurately along the frame until the right-hand edge of the sloping line of the gauge touches the correct datum line or point of the corner letter. 'a' is read from the position on the scale nearest to the middle of the letter. In similar fashion for measurement 'd', the right or vertical scale of the gauge is used to determine the distance from the inside of ESE, the east frame of the SE square. For measurements 'b' and 'c', the horizontal scale of the gauge is used to measure the distances from SSW or SSE, the lower frame of the corner squares, to the letters. The relevant datum lines or points of the left and right corner letters may be seen from Figs. 4 and 5 respectively.

Supplies of the original alphabet comparator and plating gauge are no longer available. Alternative methods include: 1). As supplied with printed copies of the second edition, an accurately enlarged, transparent measuring gauge with a single scale, based upon enlarged photocopies of the original plating guide. This may be duplicated by scanning a comparator and a 1d red, then printing an enlargement on a clear acetate sheet. The sheet is placed over enlarged stamp images on a computer screen. 2). John McCulloch's online tool for plating 1d reds using the Fisher-Brown system is now hosted on the GBPS website, including the E-Gauge for measurement.

Fig. 4 Relevant datum lines or points of the southwest corner letters

Fig. 5 Relevant datum lines or points of the southeast corner letters

With the enlarged, transparent measuring gauge, adjust a scan of the stamp so that the outer frame of the design matches the rectangle on the overlay, with the single scale used for all four measurements 'a', 'b', 'c' and 'd'. The scale is cropped at 17, since only two units utilise this top end of the scale: AE plate 82, 'a' = 17; BA plate 97, 'd' = 17+. One helpful advantage of this technique is less discomfort for the plater who was previously leant over a magnifier. In Fig. 6, measurement of the four coordinates is shown for a stamp lettered AK, and the need for care to avoid error is illustrated in Fig. 7.

Fig. 6 Measurement of the four coordinates 'a', 'b', 'c' and 'd'

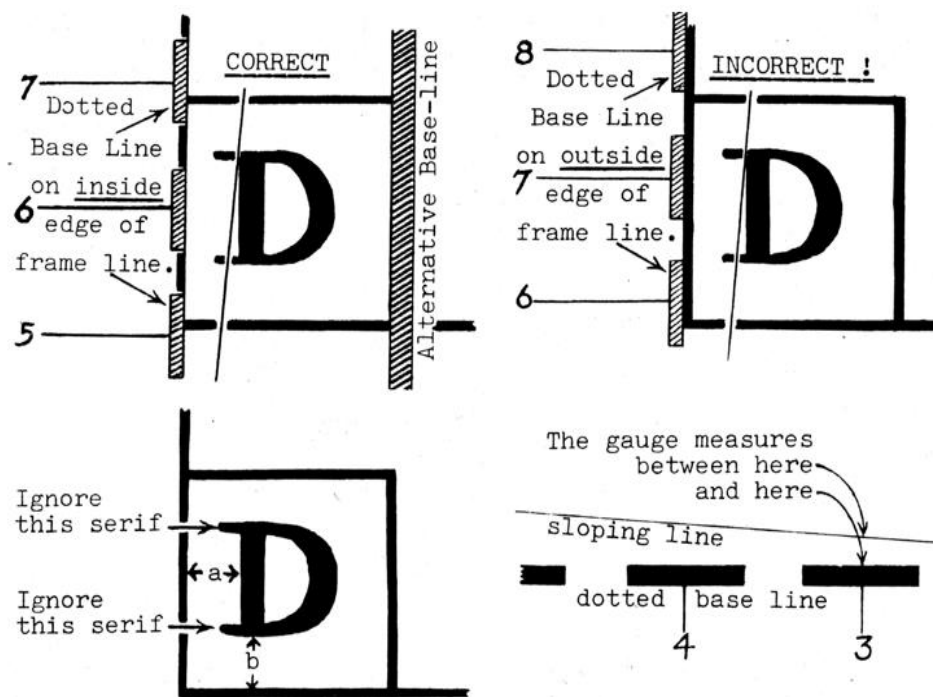

Fig. 7 Demonstrating the need for care to avoid error

The plating tables are arranged in alphabetical order from AA to TL. They comprise sets of four numbers, corresponding to the measurements 'a', 'b', 'c' and 'd' allocated to each stamp position of all the individual printing plates from which the die 1, 1d stamps were printed. The measurements are determined more precisely by subdividing each value of the scales into three positions, eg 5-, 5, 5+. In

The online Mulready Group introduced some sensible additions and revisions to the existing conventions found in *The Plating of the Penny*, in order to better describe extended or defective serifs; these were included in the second edition of the rearranged Fisher-Brown measurements. SfJn represents serifs joined, which applies to the inner serifs of 'A', 'H', 'K' and 'M'; SfX[ ] represents serif extended, replacing XSf. Serif positions [Fig. 8] are numbered according to their positions in relation to a quadrant positioned centrally over the letter, starting at position '1' for the bottom, left quadrant and incrementing clockwise to '4' for bottom right. Serifs associated with the horizontal centreline through the letters 'E', 'F' and 'G' are position '5'.

Fig. 8 Notation of serif positions

A range of extended serifs is illustrated and described in Fig. 9. The positions of serifs are shown in brackets SfX[ ]; eg an extended top serif to 'D' is noted as 'D'SfX[2]'. Where all serifs are extended, it is not necessary to state positions; eg both serifs extended on 'D' would be noted as 'D'SfsX'. In some cases it may be necessary to indicate the direction; thus a bottom serif on the upright of 'R' extending to the right would be 'R'SfXE[1]' or, to the left, 'R'SfXW[1]'. A letter with serifs joined is expressed as SfsJn. However, if only the top or bottom serifs are joined, then this is expressed as SfsJnT or as SfsJnB respectively. The Mulready Group introduced an enhanced description for a skewed or misaligned corner frame, skewed in Sko or out Ski, eg: ESEsko representing E frame-line of SE square skewed out and SSESki representing S frame-line of SE square skewed in. This Editor also adopted some further, minor amendments: Dg supersedes *diag.* to represent diagonal; Hz supersedes *Horiz.* to represent horizontal; Jn to represent joins or joined; Vt supersedes *Vert.* to represent vertical. Throughout the text, when referring to the plate numbers of the reserve plates, the Editor has inserted a comma between 'R' and the number, consistent with the engraving of the printing plates, as seen on registration sheet examples shown in Fig. 10.

A recent amendment, following an innovation suggested by Brian Perrett, concerns the position of dots and marks on or outside the west and east frames. Rather than measuring to fractions of a millimetre, numbered positions [1] to [8] indicate the location of the detail, the numbered zones corresponding to areas between intersections of the engraved side lattice, as shown in Fig. 12. Examples of such changes would be:

JA 203	M/E 4¼mm up	superseded by	M/E[1]
KH 203	M 8mm down E*	superseded by	ME[5]-[6]*
LJ 195	M.W opposite nose	superseded by	M.W[5]

GUIDELINES

During the laying down of plates 1 to 56, vertical and horizontal lines were scribed on the plates to assist positioning of the impressions. These lines would be removed during the clean-up stage of plate manufacture but traces of these guide-lines may still be detected in the corner squares, (usually the upper corners), and sometimes in the margins.

VERTICAL GUIDE-LINES, NORTHWEST CORNER

VERTICAL GUIDE-LINES, NORTHEAST CORNER

The horizontal guide-lines were generally low in the corner squares but from plate 19 onwards the horizontal guide-lines were usually close to the top of the value.

**PLATE CHARACTERISTICS**

The tables of plate characteristics provide an overview or summary of known or recorded information regarding the individual printing plates. Dates and certain printing details may be modified in the future as fresh evidence emerges. Within the lettering tables, the abbreviations 'a', 'b', 'c' and 'd' are used solely for the relevant measurements: not positions. Hence the ambiguous 'aX', 'bX', 'cX' and 'dX' are superseded by WSWX, SSWX, SSEX and ESEX, etc. The earliest known date of use is based on reported examples and therefore indicative only. The Penny Black went on sale Friday 1 May 1840 but was not officially valid for postage until Wednesday 6 May 1840.

**MISSING DATA 2021**

Listed below are the plate positions of missing imprimaturs and/or stamps which remain unlocated or unidentified up to February 2021; hence the data are not yet recorded in the tables of measurements.
